Environmental Determinants of Human Health Jozef M. Pacyna, Elisabeth G. Pacyna, 2016-10-18 Polluted air and contaminated food and water are major causes of human health deterioration, but public health policy has long struggled to effectively address these concerns. This timely book--written for a wide audience of policy makers, researchers, and general readers--synthesizes what we already know about environmental hazards, identifies the gaps in our knowledge, and provides a roadmap for reducing human exposure to environmental pollution. With contributions from leading experts, *Environmental Determinants of Human Health* examines numerous pollutants, both inorganic and organic, in the context of their human health impacts. Individual chapters explore exposure pathways, macroeconomic impacts of human health deterioration, technological and non-technological methods for reducing exposures, monetary and non-monetary benefits from exposure reduction, and risk communication and awareness, including citizen participation approaches. This volume is a crucial text for policy makers requiring scientific justification for the development of new environmental regulations, scientists researching public health and environmental contamination, and members of the public interested in human health issues.

Privatization and Regulation of Transport Infrastructure Antonio Estache, Ginés de Rus, 2000-01-01 The 1990s saw an increase in the liberalisation of transport policies and a strengthening of the role of private operators and investors in transport infrastructure worldwide. The search for sustained improvement in efficiency is probably secondary to the need to find additional financing, but it is improvement in services that is at the core of the new role of the government in transport. Governments must now become fair economic regulators of many of the privately operated transport services and infrastructures. This book examines the major challenges that governments are likely to face in taking on their new role in transport.

Environmental Coastal Regions III G. R. Rodríguez, C. A. Brebbia, E. Pérez-Martell, 2000 The proceedings of the Third International Conference on Environmental Problems in Coastal Regions. Particular emphasis is placed on the development of computer models which can reproduce not only normal behaviour but also extreme conditions, and on practical applications carried out around the world. Topics covered include: pollution management and decision analysis; hazard mitigation and risk analysis; harbours, ports and marinas; littoral drift; coastal erosion; oil slicks and spills; acoustic pollution; sewage and chemical pollution; atmospheric pollution and control; water quality models; and case studies.

Advanced Scanning Electron Microscopy and X-Ray Microanalysis Patrick Echlin,C.E. Fiori,Joseph Goldstein,David C. Joy,Dale E. Newbury,2013-06-29 This book has its origins in the intensive short courses on scanning electron microscopy and x-ray microanalysis which have been taught annually at Lehigh University since 1972. In order to provide a textbook containing the materials presented in the original course, the lecturers collaborated to write the book Practical Scanning Electron Microscopy (PSEM), which was published by Plenum Press in 1975. The course continued to evolve and expand in the ensuing years, until the volume of material to be covered necessitated the development of separate introductory and advanced courses. In 1981 the lecturers undertook the project of rewriting the original textbook, producing the volume Scanning Electron Microscopy and X-Ray Microanalysis (SEM/XM). This volume contained substantial expansions of the treatment of such basic material as electron optics, image formation, energy-dispersive x-ray spectrometry, and qualitative and quantitative analysis. At the same time, a number of chapters, which had been included in the PSEM volume, including those on magnetic contrast and electron channeling contrast, had to be dropped for reasons of space. Moreover, these topics had naturally evolved into the basis of the advanced course. In addition, the evolution of the SEM and microanalysis fields had resulted in the development of new topics, such as digital image processing, which by their nature became topics in the advanced course.

Drying Of Loose And Particulate Materials R. B. Keey,1991-09-01 This work furnishes students and practising engineers with a guide to the principles of industrial drying of particulate and loose solids and with advice on improved design procedures. The book focuses on those processes considered by the author to be the most effective in the current field.

A Natural History of Mount Le Conte Ken Wise,Kenneth Wise,1998 Widely regarded as the crown jewel of the Great Smoky Mountains, Mount Le Conte harbors the greatest concentration of notable geological features in all of the Smokies. This unique book tells the history of the mountain, offering visitors a greater appreciation of its scenic splendor. Kenneth Wise and Ron Petersen combine their intimate knowledge of Le Conte with a wealth of scientific and historical information. Following introductory coverage of the mountain's geologic history and human exploration, they follow the six main trails up

the mountain--Alum Cave, Bullhead, Rainbow Falls, Trillium Gap, Brushy Mountain, and Boulevard--and reveal each one to be not merely a path but a rich source of historical and personal testimony. A final chapter covers the distinguishing features of the summit itself. Along each route, the authors explain how the trail was developed and provide historic background for well-known landmarks, from Inspiration Point to Huggins Hell. They offer informative descriptions of the plants and wildlife indigenous to Mount Le Conte as well as observations on the effects of environmental changes on the landscape. The book is illustrated with dozens of photographs, many of historic interest. Also included is a fold-out vista map of ten panoramas visible along the way, indicating the notable features that can be seen from each vantage point. The Authors: Kenneth Wise is an administrator at the University of Tennessee library and the author of *Hiking Trails of the Great Smoky Mountains: A Comprehensive Guide*. Ron Petersen is a distinguished professor in the Department of Botany at the University of Tennessee in Knoxville. Ron Petersen and Kenneth Wise combine their intimate knowledge of Mount LeConte with a wealth of scientific and historical information. Following the six main trails up the mountain--Alum Cave, Bullhead, Rainbow Falls, Trillium Gap, Brushy Mountain, and Boulevard--they tell how each was developed and provide historic notes and descriptions for well-known landmarks, from Inspiration Point to Huggins Hell. They also point out a host of interesting features about plants and wildlife and offer observations on effects of environmental changes on the landscape. The text is enhanced by dozens of photographs, many of historic interest. Also included with the book is a fold-out vista map containing drawings of eight panoramas visible from the summit, indicating the geologic features that can be seen from each vantage point. Whether you're viewing LeConte from the Lodge or hiking its slopes, this book will enhance your enjoyment of this crown jewel of the Smokies. *A Natural History of Mount LeConte* is unlike any other book available on this magnificent mountain. It shows that history and natural history are two sides of the same coin and will make visiting or hiking the peak a more rewarding experience.

Introduction to Global Energy Issues Renaud Gicquel, May Gicquel, 2013-08-06 From the discovery of fire to that of the atom, the development of human societies has largely been based on the conquest of energy. In all countries, energy has gradually become one of the key factors of social and economic development, as well as capital, labor and natural resources, and now no one can do without it. After decades of cheap energy

Nonlinear Approximation Theory Dietrich Braess, 2012-12-06 The first investigations of nonlinear approximation problems were made by P.L. Chebyshev in the last century, and the entire theory of uniform approximation is strongly connected with his name. By making use of his ideas, the theories of best uniform approximation by rational functions and by polynomials were developed over the years in an almost unified framework. The difference between linear and rational approximation and its implications first became apparent in the 1960's. At roughly the same time other approaches to nonlinear approximation were also developed. The use of new tools, such as nonlinear functional analysis and topological

methods, showed that linearization is not sufficient for a complete treatment of nonlinear families. In particular, the application of global analysis and the consideration of flows on the family of approximating functions introduced ideas which were previously unknown in approximation theory. These were and still are important in many branches of analysis. On the other hand, methods developed for nonlinear approximation problems can often be successfully applied to problems which belong to or arise from linear approximation. An important example is the solution of moment problems via rational approximation. Best quadrature formulae or the search for best linear spaces often leads to the consideration of spline functions with free nodes. The most famous problem of this kind, namely best interpolation by polynomials, is treated in the appendix of this book.

Engineering Heat Transfer M. M. Rathore, R. Kapuno, 2010-06-30 Intended as a textbook for undergraduate courses in heat transfer for students of mechanical, chemical, aeronautical, and metallurgical engineering, or as a reference for professionals in industry, this book emphasizes the clear understanding of theoretical concepts followed by practical applications. Treating each subject analytically and then numerically, it provides step-by-step solutions of numerical problems through the use of systematic procedures by a prescribed format. With more than a million users in industry, MATLAB is the most popular computing programming language among engineers. This Second Edition has been updated to include discussions on how to develop programs that solve heat transfer problems using MATLAB, which allows the student to rapidly develop programs that involve complex numerical and engineering heat transfer computations.

Computer Vision-ECCV '92 Giulio Sandini, 1992-04-29 This volume collects the papers accepted for presentation at the Second European Conference on Computer Vision, held in Santa Margherita Ligure, Italy, May 19-22, 1992. Sixteen long papers, 41 short papers and 48 posters were selected from 308 submissions. The contributions are structured into 14 sections reflecting the major research topics in computer vision currently investigated worldwide. The sections are entitled: features, color, calibration and matching, depth, stereo-motion, tracking, active vision, binocular heads, curved surfaces and objects, reconstruction and shape, recognition, and applications.

Application of Fracture Mechanics to Composite Materials K. Friedrich, 2012-12-02 This multiauthor volume provides a useful summary of current knowledge on the application of fracture mechanics to composite materials. It has been written to fill the gap between the literature on fundamental principles of fracture mechanics and the special publications on the fracture properties of conventional materials, such as metals, polymers and ceramics. The data are represented in the form of about 420 figures (including diagrams, schematics and photographs) and 80 tables. The author index covers more than 500 references, and the subject index more than 1000 key words.

Superalloys, Supercomposites and Superceramics John K Tien, Thomas Caulfield, 1989-04-28 Superalloys, Supercomposites and Superceramics reviews the state of superalloy technology and some of the more salient aspects of

alternative high temperature systems such as superceramics and supercomposites. Superalloy topics range from resource availability to advanced processing such as VIM, VAR, and VADAR, along with investment casting and single crystal growth, new superplastic forming techniques and powder metallurgy, structure property relationships, strengthening mechanisms, oxidation, hydrogen embrittlement, and phase predictions. This book is comprised of 22 chapters that explore key issues of high temperature materials in a synergistic manner. The first chapter reflects on the growth of the superalloy industry and its technology over the past 40 years. The discussion then turns to some of the trends in superalloy development, focusing on what is understood to be meant by the term strategic materials and the current status of resources and reserves in the United States. Particular attention is given to the supply sources and availability of strategic materials. The results achieved from the research program undertaken by NASA Lewis Research Center named Conservation Of Strategic Aerospace Materials (COSAM) are also presented. The chapters that follow explore alternative high temperature systems such as intermetallics, fiber reinforced superalloys, and the processing and high temperature properties of ceramics and carbon-carbon composites. This book will be a valuable resource for professionals and graduate students interested in learning about superalloys, supercomposites, and superceramics.

Approximation by Spline Functions Günther Nürnberger, 2013-11-20 Splines play an important role in applied mathematics since they possess high flexibility to approximate efficiently, even nonsmooth functions which are given explicitly or only implicitly, e.g. by differential equations. The aim of this book is to analyse in a unified approach basic theoretical and numerical aspects of interpolation and best approximation by splines in one variable. The first part on spaces of polynomials serves as a basis for investigating the more complex structure of spline spaces. Given in the appendix are brief introductions to the theory of splines with free knots (an algorithm is described in the main part), to splines in two variables and to spline collocation for differential equations. A large number of new results presented here cannot be found in earlier books on splines. Researchers will find several references to recent developments. The book is an indispensable aid for graduate courses on splines or approximation theory. Students with a basic knowledge of analysis and linear algebra will be able to read the text. Engineers will find various practical interpolation and approximation methods.

No Place for the Weary Kind Courtney Lix, 2016-04-05 This biography celebrates the lives of 19 Smoky Mountain Women, from hiking legend Margaret Stevenson to famed singer-songwriter Dolly Parton.
